

Arestin® Periodontal Treatment

What is it?

Arestin® is a bioresorbable gel containing an antibiotic. It has been FDA approved for treatment of gum disease after a deep cleaning procedure known as scaling and root planing.

How does it work on gum disease?

When placed in a periodontal pocket, Arestin® maintains a high-level of antibiotic right at the gum disease site without exposing the rest of the body to antibiotics. This allows treatment using one-hundredth the usual pill-form dose. It directly fights the gum disease infection for 14 days.

How do I get the best results from my treatment with Arestin®?

Avoid touching the treated areas.

Wait 12 hours after your treatment before brushing teeth.

Wait 10 days before using floss, toothpicks, or other devices designed to clean between the treated teeth.

Avoid foods for 1 week that could hurt your gums.

Don't chew gum or eat sticky foods.

After 10 days, resume cleaning between the treated teeth on a daily basis.

Remember, you must do your part. Eighty percent of treatment success rate is dependent on the patient.

Following these instructions very closely will greatly help your comfort, and promote uneventful healing of the area. If any of the instructions are not followed, you might have significantly more discomfort, and the success of the procedure may be affected.
